## Shopping around?

How households adjust to changing economic conditions

Rachel Griffith, Martin O'Connell and Kate Smith Institute for Fiscal Studies

June 2014

## Background

- The Great Recession (2008-9):
- increased unemployment, reduction in real wages and falls in asset prices
- large increase in the price of food - larger and more persistent than elsewhere
- Households responded by cutting food expenditure
- Policy concern about the prevalence of "food poverty/insecurity"

## Large food price increases

## Summary

- Study how households adjusted food spending in response to changes in economic environment over 2005-2012
- Show that households:
- reduced the number of calories they bought
- switched to cheaper calories
- Households able to mitigate the impact of deteriorating economic conditions on quality of diet

## How did households adjust?

- Outline a simple model of consumer shopping behaviour
- Household can adjust to changes in economic environment by choosing:
- number of calories to purchase
- characteristics of the shopping basket
- time to spend searching for lower prices
- Use model to motivate empirical study of the relative importance of each adjustment mechanism

## A model of grocery shopping

- Household's utility from shopping basket: $v(C, z)$
- C: total calories
- z: a vector of calorie characteristics
- includes nutrient and 'non-nutrient' characteristics
- $z^{\prime}$ denotes 'cooking requirement' of calories
- Price paid per calorie for grocery basket: $P=P(e, \mathbf{z} ; \phi)$
- e: shopping effort; expect $\partial P / \partial e<0$
- $\phi$ : unobserved characteristics

## A model of grocery shopping

- Household chooses shopping effort, total calories and characteristics of grocery basket to minimise costs:

$$
\begin{gathered}
\min _{e, C, \mathbf{z}} P(e, C, \mathbf{z} ; \phi) C+\omega\left(e+z^{\prime}\right) \\
\text { s.t. } \quad v(C, \mathbf{z})=\bar{v}
\end{gathered}
$$

- Household choice over non-food and over labour/leisure are captured by opportunity cost of time, $\omega$, and total resources allocated to groceries, $\bar{v}$

## A model of grocery shopping

## First order conditions

- shopping effort

$$
-\frac{\partial P}{\partial e} C=\omega
$$

- total calories

$$
P=\lambda \frac{\partial v}{\partial C}
$$

- characteristics:

$$
\begin{aligned}
\frac{\partial P}{\partial z_{k}} C & =\lambda \frac{\partial v}{\partial z_{k}} \quad z_{k} \neq z^{\prime} \\
\frac{\partial P}{\partial z^{\prime}} C+\omega & =\lambda \frac{\partial v}{\partial z^{\prime}}
\end{aligned}
$$

## Empirical strategy

- Use panel data on households' food purchases to estimate relationship between price paid per calorie, $P$, and choice variables, $(e, \mathbf{z})$
- Control for other factors that influence $P$
- Use to quantify impact of changes in behaviour on price paid per calorie over the recession
- And the relative contribution of each margin of adjustment

## Empirical form

## Measuring price paid per calorie

- Let $h$ denote households, $t$ denote time
- Measure the price household pays for its monthly grocery basket, $P_{h t}$, as weighted average of the transaction prices the household pays:

$$
P_{h t}=\sum_{i s d \in t}\left(\frac{p_{i s d}}{c_{i}}\right) w_{h i s d}
$$

- where $i$ indexes products, $s$ stores and $d$ dates and:
- $p_{i s d}$ is the transaction price
- $c_{i}$ is number of calories in product $i$
- $w_{\text {hisd }}=\frac{c_{i} b_{\text {bisd }}}{\sum_{i^{\prime} s^{\prime} d^{\prime} \in t} \in c_{i} b_{h i^{\prime} s^{\prime} d^{\prime}}}$
- $b_{\text {hisd }} \in\{0,1,2, \ldots\}$ is the number of purchases of product $i$ from store $s$ on date $d$

## Empirical form

## Price function

- We specify the price function as having a log-log functional form:

$$
\ln P_{h t}=\alpha \ln \mathbf{e}_{\mathbf{h t}}+\beta \ln \mathbf{z}_{\mathbf{h t}}+\gamma \mathbf{x}_{\mathbf{h t}}+\tau_{h t}+\eta_{h}+\epsilon_{h t}
$$

where

- $\mathbf{e}_{\mathbf{h t}}, \mathbf{z}_{\mathbf{h t}}$ : vectors of choice variables
- $\mathbf{x}_{\mathbf{h t}}$ : time-varying household characteristics
- $\tau_{t}$ : common region-time (year-month) effects
- $\eta_{h}$ : household effects
- Assume that:

$$
\mathbb{E}\left(\epsilon_{h t} \mid \mathbf{e}_{\mathbf{h}}, \mathbf{z}_{\mathbf{h}}, \mathbf{x}_{\mathbf{h}}, \boldsymbol{\tau}_{\mathbf{h}}, \eta_{h}\right)=0, \quad t=1, \ldots, T
$$

where $\mathbf{e}_{\mathbf{h}}=\left(\mathbf{e}_{h 1}, \ldots, \mathbf{e}_{h T}\right)$ etc.

## Identification

- Interested in identifying how changes in household choice variables $\left(\mathbf{e}_{\mathbf{h t}}, \mathbf{z}_{\mathbf{h t}}\right)$ affect $P_{h t}$
- Exploit differential within household variation in shopping choices using detailed measures of grocery shopping behaviour
- Require market prices $p_{i s d} s$ to be uncorrelated with ( $\mathbf{e}_{\mathbf{h t}}, \mathbf{z}_{\mathbf{h t}}$ ), conditional on fixed effects, region-time effects and demographics

## Identification

- Interested in identifying how changes in household choice variables $\left(\mathbf{e}_{\mathbf{h t}}, \mathbf{z}_{\mathbf{h t}}\right)$ affect $P_{h t}$
- Exploit differential within household variation in shopping choices using detailed measures of grocery shopping behaviour
- Require market prices $p_{i s d} s$ to be uncorrelated with ( $\mathbf{e}_{\mathbf{h t}}, \mathbf{z}_{\mathbf{h t}}$ ), conditional on fixed effects, region-time effects and demographics
- UK supermarkets implement national pricing policies
- Supermarket coverage varies geographically - region-time effects absorb differential price trends across region

## Identification

- Interested in identifying how changes in household choice variables $\left(\mathbf{e}_{\mathbf{h t}}, \mathbf{z}_{\mathbf{h t}}\right)$ affect $P_{h t}$
- Exploit differential within household variation in shopping choices using detailed measures of grocery shopping behaviour
- Require market prices $p_{i s d} s$ to be uncorrelated with ( $\mathbf{e}_{\mathbf{h t}}, \mathbf{z}_{\mathbf{h t}}$ ), conditional on fixed effects, region-time effects and demographics
- Require that household level transaction weights $w_{\text {hisd }} s$ do not vary in ways other than through, but correlated with, explanatory variables
- Possible issues: differences in shopping productivity across households, or demographic transitions
- Inclusion of household fixed effects and demographic variables help deal with this

## Data - Kantar Worldpanel

- Data on all grocery purchases made by a representative panel of British households over 2005-2012:
- includes groceries brought into the home
- recorded using handheld scanner in home
- details of individual products and stores
- exact price and quantity
- nutritional and other product and store characteristics
- Use data from 14,694 households and over 450,000 'shopping baskets'

## Changes in food expenditure and calories

|  | $2005-2007$ | $2010-2012$ | Change | \% change |
| :--- | ---: | ---: | ---: | ---: |
| Real expenditure (£) | 114.52 | 107.27 | -7.25 | -6.33 |
| Calories | 2300 | 2274 | -25 | -1.10 |

Notes: Numbers per adult equivalent. Real food expenditure is nominal expenditure on food at home deflated by the CPI component for food and drink at home (in 2008 prices).

## Proxies for shopping effort ( $\mathbf{e}_{\mathbf{h t}}$ )

|  | $2005-2007$ | $2010-2012$ | Change | \% change |
| :--- | ---: | ---: | ---: | ---: |
| Number of shopping trips <br> (Ntrips) | 14.87 | 14.87 | -0.00 | -0.00 |
| Number of chains visited <br> (Nstores) | 3.70 | 3.83 | 0.13 | 3.44 |
| Share of calories from discounter <br> (DISCOUNTER) | 10.24 | 11.85 | 1.61 | 15.67 |
| Share of calories bought on sale <br> (SALE) | 24.84 | 33.93 | 9.09 | 36.60 |
| Share of available calories on sale <br> (SALE_AV) | 17.19 | 22.71 | 5.51 | 32.06 |

## Basket characteristics $\left(\mathbf{z}_{\mathbf{h t}}\right)$ - nutrients

- Macronutrients:
- share of calories from: protein, saturated fat, unsaturated fat, sugar, non-sugar carbohydrates
- Micronutrients:
- grams of salt and fibre per 100 g of groceries
- Food groups:
- fruit, vegetables, grains, dairy, cheese and fats, poultry and fish, red meat, drinks, prepared sweet, prepared savoury, alcohol

## Basket characteristics $\left(\mathbf{z}_{\mathbf{h t}}\right)$ - Other

| Share of calories from: | $2005-2007$ | $2010-2012$ | Change | \% Change |
| :--- | ---: | ---: | ---: | ---: |
| Generic products (GEN) | 10.92 | 12.97 | 2.05 | 18.75 |
| Big pack sizes (BIG) | 32.31 | 30.86 | -1.46 | -4.51 |

## Coefficient estimates

## Implied opportunity cost of time

- Can use first order condition for choice of shopping effort to infer path of opportunity cost of time
- Model implies

$$
\omega_{h t}=\alpha \frac{P_{h t} C_{h t}}{1+e_{h t}}
$$

## Implied opportunity cost of time

- Can use first order condition for choice of shopping effort to infer path of opportunity cost of time

## Changes in nutritional quality

- $36 \%$ of fall in average price paid per calorie due to behaviour is a result of changes in nutritional characteristics
- Households switched away from protein, saturated fat, vegetables and alcohol...
- and towards calories higher in fibre, unsaturated fat, carbohydrates and from prepared savoury foods
- We use a single index measure of diet quality (the Healthy Eating Index) which aggregates changes in nutrients and food groups
- Suggests slight improvement in diet
- Largest (but still small) increase for households with young children

## Summary

- Period of Great Recession saw large changes to economic environment
- Led to concerns over widespread 'food insecurity'
- We show that:
- calorie purchases fell but by less than 'real' food expenditure
- households switched to cheaper calories
- on average, $64 \%$ of switch was due to more shopping effort and adjustment of non-nutrient basket characteristics
- rest due to adjustment of nutrient characteristics, but little evidence of decline in nutritional quality of grocery basket
- Households were relatively successful in weathering economic turbulence with respect to food consumption

## Changes in food at home and food out (from LCFS)

| Real expenditure | 2005-2007 | 2010-2011 | Change | \% change |
| :---: | :---: | :---: | :---: | :---: |
| Food at home | 121.02 | 114.00 | -7.02 | -5.8 |
| Food out | 70.45 | 63.76 | -6.69 | -9.8 |
| Calories |  |  |  |  |
| Food at home | 2505 | 2478 | -27 | -1.1 |
| Food out | 381 | 342 | -39 | -10.3 |

Notes: Numbers per adult equivalent. Real expenditure is nominal expenditure deflated by the corresponding CPI component. Numbers from LCFS.

## Nutrient characteristics

| Share of calories from: | $2005-2007$ | $2010-2012$ | Change | \% change |
| :--- | ---: | ---: | ---: | ---: |
| Protein (shr_prot) | 14.88 | 14.76 | -0.12 | -0.81 |
| Saturated fat (shr_sfat) | 14.83 | 14.59 | -0.23 | -1.57 |
| Unsaturated fat (shr_ufat) | 22.64 | 22.79 | 0.15 | 0.67 |
| Sugar (shr_sug) | 22.73 | 22.82 | 0.09 | 0.41 |
| Non-sugar carbohydrates (shr_othcarbs) | 24.92 | 25.03 | 0.11 | 0.43 |
| g per loog of: |  |  |  |  |
| Fibre (fibre) | 1.12 |  |  |  |
| Salt (salt) | 0.50 | 1.19 | 0.07 | 6.32 |
| Share of calories from: |  | 0.49 | -0.00 | -0.10 |
| Fruit (shr_Fruit) |  |  |  |  |
| Vegetables (shr_Veg) | 5.08 | 5.28 | 0.20 | 3.86 |
| Grains (shr_Grains) | 6.97 | 6.43 | -0.54 | -7.81 |
| Dairy (shr_Dairy) | 16.40 | 16.65 | 0.24 | 1.48 |
| Cheese and fats (shr_CheeseFats) | 9.53 | 9.49 | -0.04 | -0.46 |
| Poultry and fish (shr_PoultryFish) | 11.73 | 11.73 | 0.01 | 0.06 |
| Red meat and nuts (shr_RedMeatNuts) | 3.09 | 3.30 | 0.21 | 6.87 |
| Drinks (shr_Drinks) | 8.34 | 7.84 | -0.51 | -6.07 |
| Prepared sweet (shr_PrepSweet) | 1.87 | 1.82 | -0.04 | -2.36 |
| Prepared savory (shr_PrepSavory) | 19.06 | 19.53 | 0.47 | 2.47 |
| Alcohol (shr_Alcohol) | 14.78 | 14.82 | 0.04 | 0.30 |

## Robustness

|  | Specification |  |
| :--- | ---: | ---: |
|  | Double-log | Polynomial |
| \% change in price per calorie due to behavior change | -3.1 | -3.0 |
| share due to |  |  |
| shopping effort | $40.8 \%$ | $45.6 \%$ |
| nutrient characteristics | $35.8 \%$ | $34.1 \%$ |
| other characteristics | $23.1 \%$ | $20.3 \%$ |
